

OCI for OpenSearch

OCI Search Service for OpenSearch is based on the OpenSearch fork of Elasticsearch which enables customers to search large datasets with results in milliseconds by leveraging a powerful index.

OCI Search Service with OpenSearch is a distributed, fully managed, and maintenance free full-text search engine. OpenSearch lets you store, search, and analyze large volumes of data quickly with fast response times. The service supports open source OpenSearch APIs and OpenSearch Dashboards data visualization. OCI Search Service with OpenSearch allows you to build in-application search that can return results in milliseconds even with large datasets.

OpenSearch, derived from Apache 2.0 licensed Elasticsearch 7.10.2 and Kibana 7.10.2, is a community-driven, open-source search and analytics suite built on Apache Lucene, a Java based search and indexing library.

It consists of:

- A search engine daemon: OpenSearch
- A visualization and user interface: OpenSearch Dashboards.

OpenSearch has many use cases but is typically used by applications to search large datasets and log analytics for quick investigation and debugging.

Solutions

AI-powered Enterprise Content Search Engine solution

CURRENT SITUATION: Have you ever needed to find relevant information in unstructured data such as invoices, contracts, emails, images, photos, videos and audio files that your company has collected over the years? Maybe you're a project manager and you're looking for projects that have previously dealt with similar requirements, or you're in sales and you're looking for past contracts with similar terms. You can browse on a shared network drive and find Excel sheets, PDF and Word documents, text files, images and audio in a dozen different formats, scanned documents, PowerPoint presentations, etc., but when there are thousands or maybe millions of files, it is not possible for you manually open them all and search for relevant information. You need automation.

SOLUTION: AI-powered Enterprise Content Search Engine provides Google-like search capability for unstructured company content stored in a cost-effective data lake (Object Storage) that is automatically searched, parsed, organized and analyzed by language, speech, vision, document AI capabilities and indexed by OpenSearch. With this solution, users can query any specific information that has been automatically extracted from documents, such as an object in images, text in scanned documents, or a keyword in audio recordings.

The proposed solution is built using cloud native OCI services, artificial intelligence and document indexing and designed using an API-First approach to easily integrate into customer applications.

BENEFITS: The AI powered Enterprise Content Search Engine solution has many benefits such as helping workers become more productive and better at what they do, reusing existing knowledge, sparking new ideas by combining multiple sources of information, generating actionable insights, higher levels of straight through processing, which is resulting in faster response times. These in turn lead to business outcomes such as lower costs and higher profitability, increased capacity to take on more work to grow the business and higher levels of customer satisfaction and brand loyalty.
